Grover's algorithm: Motivation

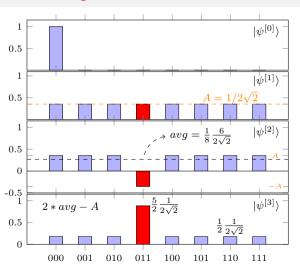

Grover's algorithm performs a search over an unorder set of 2^n items fo find the unique element that satisfies some condition

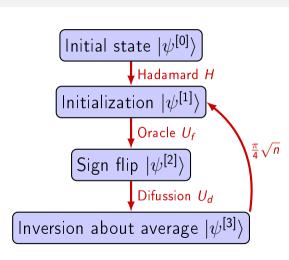

- Classic approach: $\sum_{i=1}^{n} \frac{1}{n}i = \frac{n+1}{1} \Rightarrow \mathcal{O}(n)$
- Quantum approach: $(...) \Rightarrow \mathcal{O}(\sqrt{n})$

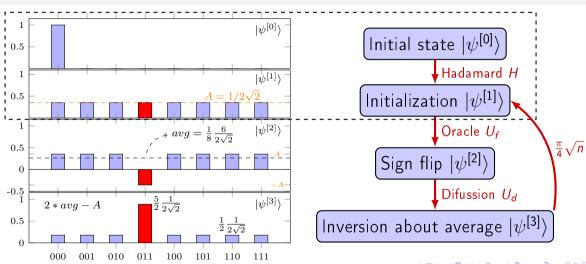

5 / 41

We find a method (unitary operator) to have all the states with the same probability (principle of superposition).

We find a method (unitary operator) to have all the states with the same probability (*principle* of superposition).

$$(I^{\otimes n} \otimes X) |0\rangle_{n+1} = |0\rangle_n \otimes |1\rangle$$

$$H^{\otimes (n+1)} [(I^{\otimes n} \otimes X) |0\rangle_{n+1}] = H^{\otimes n} |0\rangle_n \otimes H |1\rangle$$

$$= \sum_{j \in \{0,1\}^n} \frac{1}{\sqrt{2^n}} |j\rangle_n \otimes \frac{1}{\sqrt{2}} (|0\rangle - |1\rangle)$$

$$= \sum_{j \in \{0,1\}^n} \alpha_j |j\rangle_n \otimes \frac{1}{\sqrt{2}} (|0\rangle - |1\rangle)$$

$$= |\psi^{[1]}\rangle$$

3-qubit example: Set ancillary qubit to $|1\rangle$

$$(I^{\otimes 3} \otimes X) |0\rangle_{3+1} = I^{\otimes 3} |0\rangle_{3} \otimes X |0\rangle$$

$$= \begin{pmatrix} 1 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 1 & 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 1 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 1 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 1 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & 1 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 & 0 & 1 \end{pmatrix} \begin{pmatrix} 1 \\ 0 \\ 0 \\ 0 \\ 0 \\ 0 \\ 0 \end{pmatrix} \otimes \begin{pmatrix} 0 & 1 \\ 1 & 0 \end{pmatrix} \begin{pmatrix} 1 \\ 0 \\ 0 \\ 0 \\ 0 \\ 0 \\ 0 \end{pmatrix}$$

$$= |0\rangle_{3} \otimes |1\rangle$$

3-qubit example: Apply Hadamard gate

imaunon

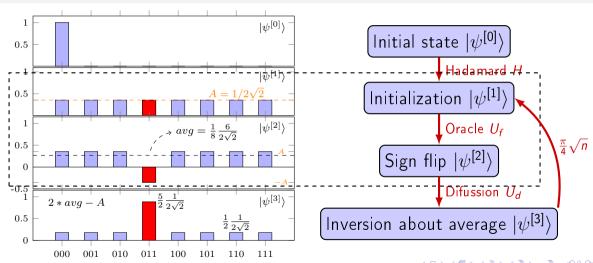

3-qubit example: Apply Hadamard gate

$$\begin{array}{lll} |\psi^{[1]}\rangle & = & \frac{1}{\sqrt{2^3}} \left(111111111\right)^{\dagger} \otimes \frac{1}{\sqrt{2}} \left(\begin{array}{c} 1 \\ -1 \end{array}\right) \\ & = & [\frac{1}{2\sqrt{2}} \left|000\right\rangle + \frac{1}{2\sqrt{2}} \left|001\right\rangle + \frac{1}{2\sqrt{2}} \left|010\right\rangle + \frac{1}{2\sqrt{2}} \left|011\right\rangle \\ & + & \frac{1}{2\sqrt{2}} \left|100\right\rangle + \frac{1}{2\sqrt{2}} \left|101\right\rangle + \frac{1}{2\sqrt{2}} \left|110\right\rangle + \frac{1}{2\sqrt{2}} \left|111\right\rangle] \\ & \otimes & \frac{1}{\sqrt{2}} \left(\left|0\right\rangle - \left|1\right\rangle\right) \end{array}$$

12 / 41

3-qubit example: Summary

$$\begin{split} |\psi^{[1]}\rangle &= H^{\otimes(3+1)}\left[(I^{\otimes 3}\otimes X)|0\rangle_{n+1}\right] \\ &= \left[\frac{1}{2\sqrt{2}}|000\rangle + \frac{1}{2\sqrt{2}}|001\rangle + \frac{1}{2\sqrt{2}}|010\rangle + \frac{1}{2\sqrt{2}}|011\rangle \\ &+ \frac{1}{2\sqrt{2}}|100\rangle + \frac{1}{2\sqrt{2}}|101\rangle + \frac{1}{2\sqrt{2}}|110\rangle + \frac{1}{2\sqrt{2}}|111\rangle\right] \\ &\otimes \frac{1}{\sqrt{2}}\left(|0\rangle - |1\rangle\right) \\ &= \sum_{j\in\{0,1\}^n} \frac{1}{\sqrt{2^n}}|j\rangle_n \otimes \frac{1}{\sqrt{2}}\left(|0\rangle - |1\rangle\right) = |\psi^{[1]}\rangle \end{split}$$

We find a method (unitary operator) which flip the sign of the state of interest.

We find a method (unitary operator) which flip the sign of the state of interest.

Quantum Oracle

It is defined the operator U_f :

$$U_f: |j\rangle_n \otimes |y\rangle_1 \rightarrow |j\rangle_n \otimes |y \oplus f(j)\rangle_1,$$

where \oplus is the sum operator in mod 2, and $f(j) = \left\{ \begin{array}{cc} 1 & j = l \\ 0 & j \neq l \end{array} \right\}$

Α	В	XOR
0	0	0
0	1	1
1	0	1
1	1	0

We apply U_f (Quantum Oracle) to the previous state $\psi^{[1]}$

$$|\psi^{[2]}\rangle = U_{f} |\psi^{[1]}\rangle$$

$$= U_{f} \left(\sum_{j \in \{0,1\}^{n}} \alpha_{j} |j\rangle_{n} \otimes \frac{1}{\sqrt{2}} (|0\rangle - |1\rangle)\right)$$

$$= U_{f} \left(\alpha_{I} |I\rangle_{n} \otimes \frac{1}{\sqrt{2}} (|0\rangle - |1\rangle) + \sum_{j \in \{0,1\}^{n}; j \neq I} \alpha_{j} |j\rangle_{n} \otimes \frac{1}{\sqrt{2}} (|0\rangle - |1\rangle)\right)$$

$$= \left(-\alpha_{I} |I\rangle_{n} + \sum_{j \in \{0,1\}^{n}; j \neq I} \alpha_{j} |j\rangle_{n}\right) \otimes \frac{1}{\sqrt{2}} (|0\rangle - |1\rangle)$$

16 / 41

We apply U_f (Quantum Oracle) to the previous state $\psi^{[1]}$

$$|\psi^{[2]}\rangle = U_{f} |\psi^{[1]}\rangle$$

$$= U_{f} \left(\sum_{\text{sign flip!}} |j\rangle_{n} \otimes \frac{1}{\sqrt{2}} (|0\rangle - |1\rangle) \right)$$

$$= U_{f} \left(\alpha |I\rangle_{n} \otimes \frac{1}{\sqrt{2}} (|0\rangle - |1\rangle) + \sum_{j \in \{0,1\}^{n}; j \neq I} \alpha_{j} |j\rangle_{n} \otimes \frac{1}{\sqrt{2}} (|0\rangle - |1\rangle) \right)$$

$$= \left(-\alpha_{I} |I\rangle_{n} + \sum_{j \in \{0,1\}^{n}; j \neq I} \alpha_{j} |j\rangle_{n} \right) \otimes \frac{1}{\sqrt{2}} (|0\rangle - |1\rangle)$$

16 / 41

We apply U_f (Quantum Oracle) to the previous state $\psi^{[1]}$

$$|\psi^{[2]}\rangle = U_{f} |\psi^{[1]}\rangle$$

$$= U_{f} \left(\sum_{\text{sign flip!}} |j\rangle_{n} \otimes \frac{1}{\sqrt{2}} (|0\rangle - |1\rangle) \right) \text{ Extra qubit!}$$

$$= U_{f} \left(\alpha |I\rangle_{n} \otimes \frac{1}{\sqrt{2}} (|0\rangle - |1\rangle) + \sum_{j \in \{0,1\}^{n}; j \neq I} \alpha_{j} |j\rangle_{n} \otimes \frac{1}{\sqrt{2}} (|0\rangle - |1\rangle) \right)$$

$$= \left(-\alpha_{I} |I\rangle_{n} + \sum_{j \in \{0,1\}^{n}; j \neq I} \alpha_{j} |j\rangle_{n} \right) \otimes \frac{1}{\sqrt{2}} (|0\rangle - |1\rangle)$$

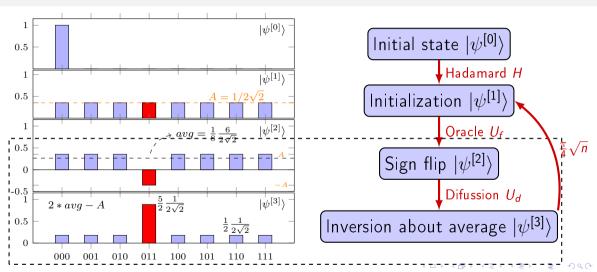

Sign flip¹

3-qubit example: Quantum Oracle

$$\begin{array}{lcl} |\psi^{[2]}\rangle & = & U_f \, |\psi^{[1]}\rangle \\ & = & [\frac{1}{2\sqrt{2}} \, |000\rangle + \frac{1}{2\sqrt{2}} \, |001\rangle + \frac{1}{2\sqrt{2}} \, |010\rangle - \frac{1}{2\sqrt{2}} \, |011\rangle \\ & + & \frac{1}{2\sqrt{2}} \, |100\rangle + \frac{1}{2\sqrt{2}} \, |101\rangle + \frac{1}{2\sqrt{2}} \, |110\rangle + \frac{1}{2\sqrt{2}} \, |111\rangle] \\ & \otimes & \frac{1}{\sqrt{2}} \, (\, |0\rangle - \, |1\rangle) \end{array}$$

17 / 41

¹This slide shows the result of applying U_f but not how is applied. This is because this step of the algorithm depends on the specific problem.

We find a method (unitary operator) to invert the amplitude about the average

19 / 41

We find a method (unitary operator) to invert the amplitude about the average

$$\sum_{j \in \{0,1\}^n} \alpha_j |j\rangle_n \xrightarrow{U_d} \sum_{j \in \{0,1\}^n} \left(2 \left(\sum_{k \in \{0,1\}^n} \frac{\alpha_k}{2^n} \right) - \alpha_j \right) |j\rangle_n,$$

where $\sum_{k \in \{0,1\}^n} \frac{\alpha_k}{2^n}$ is the average.

$$\sum_{k \in \{0,1\}^n} \frac{\alpha_k}{2^n} = \frac{1}{2^3} \frac{6}{2\sqrt{2}}$$

Difussion operator

$$U_{d} = \begin{pmatrix} \frac{2}{2^{n}} & \frac{2}{2^{n}} & \cdots & \frac{2}{2^{n}} \\ \frac{2}{2^{n}} & \frac{2}{2^{n}} & \cdots & \frac{2}{2^{n}} \\ \vdots & \vdots & \ddots & \vdots \\ \frac{2}{2^{n}} & \frac{2}{2^{n}} & \cdots & \frac{2}{2^{n}} \end{pmatrix} - I^{\otimes n} = \cdots = -H^{\otimes n}DH^{\otimes n}, \tag{1}$$

where
$$D = diag(-1, 1, 1, \dots, 1)$$

3-qubit example: Difussion operator in python

```
>>> import numpy as np
>>> H1 = 1/np.sqrt(2)*np.array([[1,1],[1,-1]]) # Hadamard operator 1 qubit
>>> H2 = np.kron(H1,H1) # Hadamard operator 2 qubit
>>> H3 = np.kron(H2,H1) # Hadamard operator 3 qubit
>>> D = np.eye(8) # Diagonal operator
>>> D \lceil 0.0 \rceil = -1
>>> Ud = -np.dot(np.dot(H3,D),H3) # Difussion operator
>> psi_2 = 1/(2*np.sqrt(2))*np.array([1,1,1,-1,1,1,1,1]) # psi_2
>>> psi_3 = np.dot(Ud.psi_2)
>>> print(psi_3)
array([0.176, 0.176, 0.176, 0.883, 0.176, 0.176, 0.176, 0.176])
```

3-qubit example: Difussion operator

Measurement & Repetition

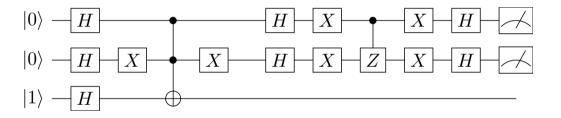

For the first iteration we measure

$$\alpha_{011} = \frac{5}{2} \frac{1}{2\sqrt{2}} \longrightarrow \|\alpha_{011}\|^2 \simeq 78, 12\%$$
 $\alpha_j = \frac{1}{2} \frac{1}{2\sqrt{2}} \longrightarrow \|\alpha_j\|^2 \simeq 3, 12\% \quad (j \neq |011\rangle)$

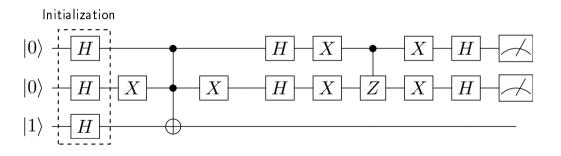

The optimal number of repetitions $R \simeq \frac{\pi}{4} \sqrt{n} \simeq 2.2$. For the second iteration (Oracle & Diffusion) we have:

Implementation

Next slides show the implementation of the algorithm in two different ways:

- Using qiskit framework. In this case we have a simulated quantun backend. The reader can copy & run the code in python in order to reproduce the experiment
- Building the gates directly in Quantum IBM computer

In both cases we will observe a histogram with an unique state $(|10\rangle)$

Backend & Quantum Registers

```
from giskit import *
from giskit import OuantumCircuit
from qiskit.circuit.quantumcircuit import QuantumCircuit
from qiskit.visualization import plot_histogram
backend = BasicAer.get_backend('gasm_simulator')
#backend = BasicAer.get backend('statevector simulator')
''' Quantum register
https://quantumcomputing.stackexchange.com/questions/4907/
qiskit — is — there — any — way — to — discard — the — results — of — a — measurement '''
q = QuantumRegister(2, 'q')
a = OuantumRegister(1. 'a')
c = ClassicalRegister(2, 'c')
```

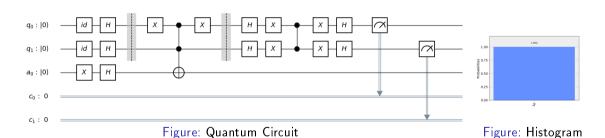

Quantum Circuit

```
#Circuit
circ = QuantumCircuit(q,a,c) # type: qiskit.circuit.quantumcircuit.Quantum Circuit
# ===== prepare the states: psi^{[0]} =====
circ.iden(q[0])
circ.iden(q[1])
circ.x(a[0])
circ.h(q[0])
circ.h(a[1])
circ.h(a[0])
circ.barrier(q)
#==== Sign flip: psi^{[2]} =====
circ.x(q[0])
circ.ccx(q[0], q[1], a[0])
circ.x(q[0])
circ.barrier(g)
#==== Inversion about average: psi^{[3]} =====
circ.h(a[0])
circ.h(q[1])
circ.x(q[0])
circ.x(q[1])
```

Measurement

```
#==== Meaurement =====
circ.measure(q,c)
#iob
job = execute(circ, backend=backend, shots=1000)
result = job.result()
#circuit
figure = circ.draw(output='mpl')
figure.savefig('../data/images/giskit-circuit.png')
#histogram
counts = result.get_counts(circ)
print("Total counts:")
print(counts)
figure = plot_histogram(counts)
figure.savefig('../data/images/qiskit-histogram.png')
```
